

## **CALCULATION OF YTM**

### **MEANING OF BOND**

It is a **financial instrument** whereby the issuer of the bond raises capital or funds at a certain cost for a certain time period and pays back the principal amount on maturity of the bond.

### **TERMS ASSOCIATED WITH BONDS**

**FACE VALUE** : It signifies the **predetermined nominal amount of a bond**. It indicates the **sum that the issuer commits to repay** to the bondholder upon reaching **maturity**.

**COUPON RATE**: It refers to the **interest rate paid on a bond**, expressed as a percentage of the bond's face value.

## **AFM FULL COURSE. Whatsapp to 8360944207**

**MATURITY** : It is the date when the bond's **principal amount** becomes due and payable to the bondholder.

**REDEMPTION VALUE**: It is the amount that the issuer of a **bond** agrees to repay to the bondholder when the bond reaches **its maturity date**.

**MARKET VALUE** : The market value of a bond is the price at which it is **commonly bought or sold in the market**.

### **DIFFERENT TYPES OF BONDS**

#### **FIXED-RATE BONDS**

When the **coupon rate on a bond remains the same** through the course of the investment, it is called Fixed-rate bonds.

#### **FLOATING RATE BONDS**

When the **coupon rate on a bond keeps fluctuating** during the course of an investment, it is called a floating rate bond.

#### **ZERO-COUPON BONDS**

## AFM FULL COURSE. Whatsapp to 8360944207

- These are a type of bond that does **not pay periodic interest or coupon payments to the bondholder.**
- They are issued at a **discounted price below their face value** and provide a **return to investors** through the **difference between the purchase price and the redemption value at maturity.**

### PUTTABLE BOND

When the **investor has a right to sell their bond** and get their money back **before the maturity date**, such type of bond is called a Puttable bond.

### CALLABLE BOND

When the **issuer of the bond** calls out his right to **redeem the bond even before it reaches its maturity** is called a Callable Bond.

### PERPETUAL BONDS

A perpetual bond is a bond with **no maturity date that is not redeemable** but pays a steady stream of interest forever.

### BEARER BOND

## AFM FULL COURSE. Whatsapp to 8360944207

A bearer bond is an **official certificate** that is issued **without a designated holder**. This means that whoever possesses the physical paper certificate can claim ownership and receive the value of the bond.

### VALUATION OF BONDS

- Bond valuation is the process of **determining the fair price, or value, of a bond.**
- Bond valuation involves calculating the **present value of a bond's future interest payments—as well as its face value** which refers to the bond's value once it matures.

$$\text{Value of Bond} = C \times \frac{1 - \frac{1}{(1+i)^n}}{i} + \frac{M}{(1+i)^n}$$

- C= Coupon payment
- i =The rate of return demanded by investors
- n = Number of payments until maturity

## AFM FULL COURSE. Whatsapp to 8360944207

**Que:** A bond, whose par value is Rs 1,0000, bears a coupon rate of 12 per cent and has a maturity period of 3 years. The required rate of return on the bond is 10 per cent. **What is the value of this bond?**

### Solution

- $C = 1200$
- $i = 10\% = 0.10$
- $n = 3$  years

### Method 1

$$\text{Value of Bond} = C \times \frac{1 - \frac{1}{(1+i)^n}}{i} + \frac{M}{(1+i)^n}$$

### Method 2

## AFM FULL COURSE. Whatsapp to 8360944207

Value of Bond= Annual Interest X PVIFA (YTM, n) +F X PVIF (YTM, n)

Value of Bond= 1200 X PVIFA (10%, 3) +10000 X PVIF (10%,3)

**Value of Bond= 1200 X 2.486+10000X 0.751 =2983+7510=10492**

No. of years	Payments(X)	PVIF $1/(1+i)^n$ (Y)			P .V(X*Y)
1	1200	$\frac{1}{(1 + 0.10)^1}$	$\frac{1}{1.10}$	0.909	1090
2	1200	$\frac{1}{(1 + 0.10)^2}$	$\frac{1}{1.21}$	0.826	991
3	1200+10000	$\frac{1}{(1 + 0.10)^3}$	$\frac{1}{1.33}$	0.751	8411
<b>Total</b>	13600		PVIFA	2.486	10492

### CALCULATION OF VALUE WITH SEMI-ANNUAL INTEREST

A bond, whose par value is 100000, bears a coupon rate of 10 per cent per annum payable semi-annually and has a maturity

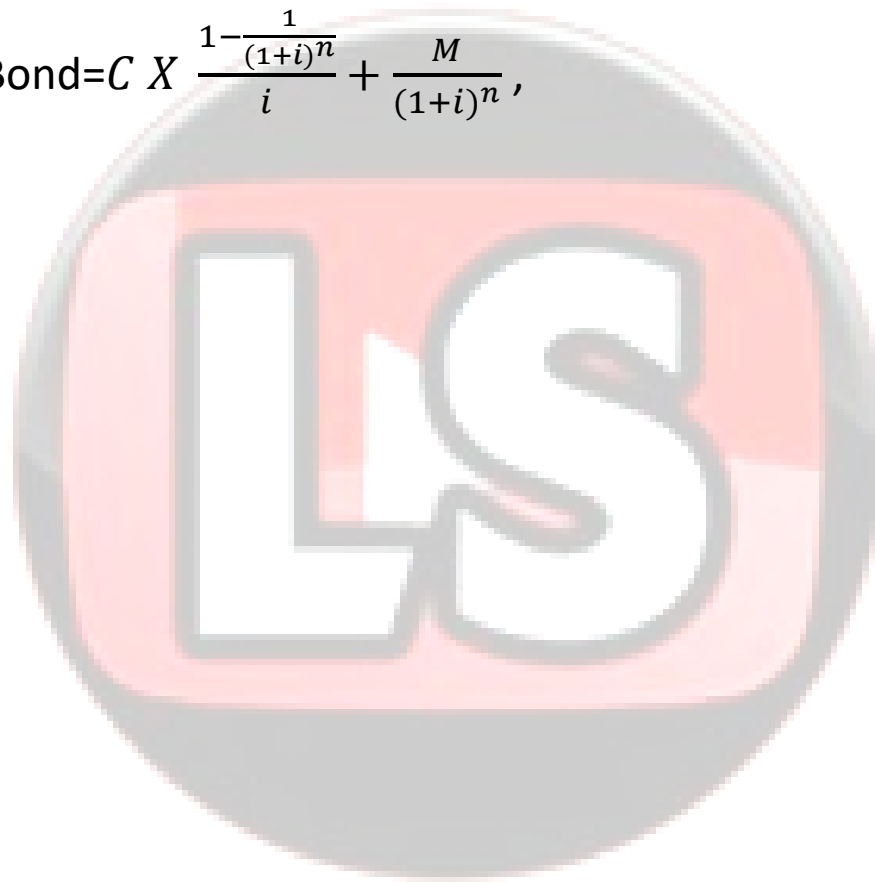

## AFM FULL COURSE. Whatsapp to 8360944207

period of 4 years. The required rate of return on bond is 8 per cent per annum . What is the value of this bond?

### Solution

#### Method 1

$$\text{Value of Bond} = C \times \frac{1 - \frac{1}{(1+i)^n}}{i} + \frac{M}{(1+i)^n},$$

### YIELD

A bond's yield represents the **return an investor can expect to receive from holding the bond.**

## CURRENT YIELD ON BOND

It measures the **rate of return earned on a bond** if it is **purchased at its current market price** and if the coupon interest is received on face value.

$$\text{Current yield} = \frac{\text{Coupon interest}}{\text{current market price}} \times 100$$

**Ex: If a bond of face value ₹10000, carrying a coupon interest rate of 10 per cent, is quoted in the market at Rs 12,000, then the current yield of the bond is?**

**Solution**

$$\text{Current yield} = \frac{\text{Coupon interest}}{\text{current market price}} \times 100,$$

## YIELD-TO-MATURITY OF BOND

- It is rate of return earned by the investor who purchases a bond and holds it till maturity.
- YTM is the discount rate or rate of return, which equals the present value of cash flows to the current price/ purchase price.

Ex: Consider a 10000-par value bond, whose current market price is Rs 9000 and coupon rate of 10 per cent and has a maturity period of 10 years. What would be the rate of return that an investor earns if he purchases the bond and holds it until maturity?

YTM

$$= \frac{\text{Annual interest} + \frac{\text{Redemable value} - \text{purchase price}}{\text{Life of bond}}}{\frac{\text{Redemable value} + \text{purchase price}}{2}} \times 100$$

### Theorems of Bond Value

1. When the required rate of return is equal to the coupon rate, the value of the bond is equal to its par value.

**Que:** XYZ Ltd company purchased 4-year bond with face value of Rs 1000, coupon 12% and required rate of return 12%. Calculate the present value of the bond.

## **AFM FULL COURSE. Whatsapp to 8360944207**

Value of Bond= Annual Interest X PVIFA (YTM, n) +F X PVIF (YTM, n)

Value of Bond = 12(PVIFA, 12%, 4) + 1000(PVIF, 12%, 4)

**Value of Bond= 120 X 3.0373+1000X 0.6355, =365+635= 1000**

**2. When the required rate of return (kd) is greater than the coupon rate, the value of the bond is less than its par value.**

**Que:** XYZ ltd company purchased 3-year bond with face value of Rs 1000, coupon 9% and required rate of return 11%. Calculate the present value of the bond.

Value of Bond= Annual Interest X PVIFA (YTM, n) +F X PVIF (YTM, n)

Value of Bond = 90 (PVIFA, 11%, 3) + 1000(PVIF, 11%, 3)

**Value of Bond= 90 X 2.4437+1000X 0.7311, =220+731= 951**

**3. When the required rate of return is less than the coupon rate, the value of the bond is greater than its par value.**

## AFM FULL COURSE. Whatsapp to 8360944207

**Que:** XYZ Ltd company purchased 3-year bond with face value of Rs 1000, coupon 12% and required rate of return 9%. Calculate the present value of the bond.

Value of Bond = Annual Interest X PVIFA (YTM, n) + F X PVIF (YTM, n)

Value of Bond =  $120(\text{PVIFA}, 9\%, 3) + 1000(\text{PVIF}, 9\%, 3)$

**Value of Bond =  $120 \times 2.531 + 1000 \times 0.772 = 303 + 772 = 1075$**

**4. When the required rate of return (kd) is greater than the coupon rate, the discount on the bond declines as maturity approaches.**

**Que:** XYZ Ltd company purchased a 3-year bond with a face value of Rs 1000, coupon 10% and required rate of return 12%. Calculate the present value of the bond and also calculate the PV of bond after 1 year.

## AFM FULL COURSE. Whatsapp to 8360944207

Value of Bond = Annual Interest X PVIFA (YTM, n) + F X PVIF (YTM, n)

Value of Bond =  $100(\text{PVIFA}, 12\%, 3) + 1000(\text{PVIF}, 12\%, 3)$

Value of Bond =  $100(2.401) + 1000(0.711) = 240 + 711 = 951$

### Value of Bond After 1 year

Value of Bond =  $100(\text{PVIFA}, 12\%, 2) + 1000(\text{PVIF}, 12\%, 2)$

Value of Bond =  $100(1.690) + 1000(0.797) = 169 + 797 = 966$

**5. When the required rate of return (kd) is less than the coupon rate, the premium on the bond declines as maturity approaches.**

**Que:** XYZ Ltd purchased 3-year bond with face value of Rs 1000, coupon 10% and required rate of return 8%. Calculate the present value of the bond and also calculate the PV of bond after 1 year.

**Que:** XYZ Ltd purchased 3-year bond with face value of Rs 1000, coupon 10% and required rate of return 8%. Calculate the

## AFM FULL COURSE. Whatsapp to 8360944207

present value of the bond and also calculate the PV of bond after 1 year.

Value of Bond = Annual Interest X PVIFA (YTM, n) + F X PVIF (YTM, n)

Value of Bond =  $100(\text{PVIFA}, 8\%, 3) + 1000(\text{PVIF}, 8\%, 3)$

Value of Bond =  $100(2.577) + 1000(0.793), = 258 + 793 = 1051$

**Value of Bond After 1 year**

Value of Bond =  $100(\text{PVIFA}, 8\%, 2) + 1000(\text{PVIF}, 8\%, 2)$

Value of Bond =  $100(1.783) + 1000(0.857), = 178 + 857 = 1035$

**6. A bond price is inversely related to its yield to maturity.**

## AFM FULL COURSE. Whatsapp to 8360944207

### Example

Suppose there is a bond with a **face value of Rs 1,000**, a **coupon rate of 5%**, and a **maturity of 5 years**. The bond pays annual coupon payments, and the prevailing **market interest rate is 5%**.

When the market **interest rate is equal to the coupon rate (5%)**, the bond is said to be **trading at par**, meaning its **price is equal to its face value (Rs 1,000)**. In this case, the bond's yield to maturity (YTM) is also 5%,

### If the Yield to Maturity Decreases

Suppose the prevailing **interest rate decreases to 3%**. As a result, the bond's yield to maturity **decreases below its coupon rate of 5%**. In this scenario, the bond **becomes more attractive to investors** because it offers a **higher coupon payment compared to the prevailing interest rate**.

**Bond prices will increase**. Investors are **willing to pay a premium to purchase the bond**, driving its price above face value.

### If the Yield to Maturity Increases

## AFM FULL COURSE. Whatsapp to 8360944207

Now, consider the opposite scenario where the **prevailing interest rate increases to 6%**. In this case, the bond's **yield to maturity would increase above its coupon rate of 5%**. The bond becomes **less attractive to investors** as the **coupon payment is lower than the prevailing interest rate**.

To make the bond more attractive at the higher yield, its **price will decrease**. **Investors** are willing to **pay less for the bond**, resulting in a price below the face value.

### DURATION OF BOND

- Since **Macaulay** was the one who first suggested the idea, it is known as the **Macaulay Duration**.
- **Bond duration is the length of time it takes for an investor to receive their money back from a bond investment.**

$$Duration = \frac{\sum pvT}{\sum pv}$$

### PROPERTIES

## AFM FULL COURSE. Whatsapp to 8360944207

- The **duration of a bond** is typically **shorter than its term to maturity**.
- The **duration of a bond equals its term to maturity** only in the case of a **zero-coupon bond**.
- There is an **inverse relationship** between the **lifetime (or term to maturity)** and the **Yield to Maturity (YTM) of a bond**.
- Increasing the **coupon frequency** reduces the duration, while decreasing the coupon frequency increases the duration.
- As a bond approaches its maturity date, its duration decreases.

**Que:** Bank ABC held a bond with a face value of Rs 10000, coupon rate 8% payable yearly and maturity after 5 years and YTM is 6%. Calculate the Duration of the bond.

A	Cash inflow	Present value factor	Present value of cash inflow	Present value X Time
---	-------------	----------------------	------------------------------	----------------------

## AFM FULL COURSE. Whatsapp to 8360944207

		$1/(1+r)^n$	(P.V.F X cash inflow)	
1	800	0.9433	754	754
2	800	0.8899	711	1422
3	800	0.8395	671	2013
4	800	0.7919	633	2532
5	10800	0.7470	8067	40335
			<b>10836</b>	<b>47056</b>

$$Duration = \frac{\sum pvT}{\sum pv} = \frac{47056}{10836} = 4.53 \text{ years}$$

### MODIFIED DURATION

It refers to its sensitivity to changes in interest rates, considering both the bond's Macaulay duration and its yield to maturity.

$$Modified\ duration = \frac{Duration}{1 + r}$$

## AFM FULL COURSE. Whatsapp to 8360944207

**Que:** Bank ABC held a bond with face value of Rs 10000, coupon rate 8% payable yearly and maturity after 5 years and YTM is 6%. Calculate the Duration of the bond.

A	Cash inflow	Present value factor $1/(1+r)^n$	Present value of cash inflow (P.V.F X cash inflow)	Present value X Time
1	800	0.9433	754	754
2	800	0.8899	711	1422
3	800	0.8395	671	2013
4	800	0.7919	633	2532
5	10800	0.7470	8067	40335
			<b>10836</b>	<b>47056</b>

$$\text{Duration} = \frac{\Sigma pvT}{\Sigma pv} = \frac{47056}{10836} = 4.53 \text{ years}$$

$$\text{Modified duration} = \frac{\text{Duration}}{1 + r} = \frac{4.53}{1.06} = 4.27$$

### BOND PRICE VOLATILITY

- It refers to the **degree of fluctuation or variation** in the **price of a bond** in response to changes in **market conditions**, particularly interest rates.
- **High volatility** indicates that the **bond's price is more sensitive to interest rate movements**, while low volatility suggests a relatively stable bond price.

$$IE = \frac{\% \text{ change in price for bond in period } t}{\% \text{ change in yield to maturity for bond}}$$

**Que:** Bank XYZ has a 10%, 8-year bond with par value of Rs 1000. The market rate changes from 10% to 12%. Calculate the interest rate elasticity of the bond.

Value of Bond =  $100 (PVIFA, 10\%, 8) + 1000 (PVIF, 10\%, 8) = 1000$

Value of Bond =  $100 (PVIFA, 12\%, 8) + 1000 (PVIF, 12\%, 8)$

Value of Bond =  $100 (4.96) + 1000 (0.40) = 496 + 400 = 896$

Change in price =  $1000 - 896 = 104, = \frac{104}{1000} \times 100 = 10.4\%$

$$IE = \frac{\% \text{ change in price for bond in period } t}{\% \text{ change in yield to maturity for bond}}, = \frac{10.4\%}{2\%} = 5.2 \%$$

### **Explanation**

In this case, the Interest Elasticity is 5.2%. This means that for every 1% change in the bond's yield to maturity, the bond's price would be expected to change by approximately 5.2%.
